On the iPhone screen is a button and 2 labels. The button is connected to a variable butt:UIButton?; and one label is connected to a variable lab:UILabel? and the other is connected to george:UILabel?. No action has yet been connected to the button.

Write a viewDidLoad method to add an action to the button. Clicking the button will cause lab to display "Batman" and george to display what lab used to display before the button was clicked.

```swift
func viewDidLoad ()

 super.viewDidLoad () {
 butt!.addTarget(self, action:
#selector(Batman),for:
            UIControl.Event.touchUpInside)
}

@objc func Batman () {

 george!.text = lab!.text
 lab!.text = "Batman"
}
```
