Northern Michigan University (Marquette Co, MI)

Time: 15 minutes

An SQLite database named "comics.db" contains a table called "COMICS". COMICS contains a field called "COMPANY", a field called "TITLE", and a numeric field called "RUN". Write Kotlin code that removes the records of all Marvel Comics, and then adds a record for a DC comic called "Rope Man" than ran for 112 issues. You do not have to write the code to open the database. You can assume it's already open and assigned to an SQLiteDatabase? variable named mComics. You may also assume that the ComicsTable class has been written appropriately for this database.

```kotlin
mComics!!.delete
     (ComicsTable.NAME,"${ComicsTable.Cols.COMPANY} = \"Marvel\"",null)
val values = ContentValues ()
values.put(ComicsTable.Cols.COMPANY,"DC")
values.put(ComicsTable.Cols.TITLE,"Rope Man")
values.put(ComicsTable.Cols.RUN,112)
mComics!!.insert (ComicsTable.NAME,null,values)
```
