Northern Michigan University (Marquette Co, MI)

Time: 15 minutes

An SQLite database named "presidents.db" contains a table called "PRESIDENTS". PRESIDENTS contains a field called "LASTNAME", a field called "FIRSTNAME" and a field called "INSTITUTION". Write Kotlin code that prints (to the screen, not to the android) all the Presidents of Northern Michigan University AND all Presidents named Trump. Should there be a President of NMU named Trump, that name should only print once.

```
var cursor = query ("INSTITUION = 'Northern Michigan University'
or LASTNAME = 'TRUMP'",null)
cursor.moveToFirst()
while (!cursor.isAfterLast){
 val prez = cursor.stuff
 println ("${prez.FIRSTNAME} ${prez.LASTNAME}")
 cursor.moveToNext()
}
```
