Time: 15 minutes

Write code for the Kotlin method

Your android activity (in Kotlin) contains a button named `myButt` and two textviews named `myTV1` and `myTV2`. Their ids in the layout file are, respectively, `button`, `TV1`, and `TV2`. Write that portion of the `onCreate()` method (not the whole method) that connects the above widgets to the layout and programs the button so that when `myButt` is clicked, the information in the two textviews swap with each other.

```
myButt = findViewById (R.id.button)
myTV1 = findViewById (R.id.TV1)
myTV2 = findViewById (R.id.TV2)

myButt!!.setOnClickListener {

    var stuff = myTV1!!.text
    myTV1!!.text = myTV2!!.text
    myTV2!!.text = stuff
}
```
